Lab 3 — Orals

11 September · 3h · lab groups of ~15

For students

Your 6 minutes:

0:00– 0:30	Set up. Repository open, terminal ready. No slides, no introduction.
0:30– 2:00	C1 — <i>"Walk me through how you framed this work. Show me one unit you would hand to a fresh agent session, and tell me what it blocks."</i>
2:00– 3:30	C2 — <i>"Show me the instruction you wrote. How do you know the agent reached it — and when would it not?"</i>
3:30– 5:00	C3 — <i>"Show me the one command that went red on the sales pipeline bug. What did it rule out?"</i>
5:00– 5:45	One follow-up question, from your repository.
5:45– 6:00	Close.

Everyone gets the same three questions. They are published here so you can prepare them — that is deliberate. What cannot be prepared is the follow-up, and that is where the top two bands are decided.

Come prepared to show, not to describe. Repository open, terminal ready, the C3 command one keystroke away. Time spent finding a file is time not spent answering.

Stay in the room. Watching fourteen other people answer the same three questions is the best revision available, and you are expected to be there for all of it. No peer grading; just watch.

Answer in French or in English, whichever you prefer. It changes nothing in the grid. What does not translate is the *vocabulary* — spec, ticket, unit of work, blocking edge, context window, handoff. Name things in those words, whichever language the sentences around them are in.
